drained from the radiators, then the summer oil was drained and winter oil put in. Batteries were disconnected and turned in for charging and storage. Tires were not deflated. The charging of the batteries was done by the service section, which was composed of repair men in such fields of motor repair as tank mechanics, battery chargers, and artificers. Armored vehicles such as half-tracks, were given a general overhauling. Oil was changed and a general inspection was made on all working parts. Tanks underwent the same inspection as half-tracks. Besides the maintenance given equipment, all trucks, half-tracks, tanks, and artillery guns were covered with a thin coat of a vaseline-like substance to prevent rusting and to keep them in proper working condition. The working mechanism on guns and tanks was not extracted, but was oiled and greased for winter.

| no further information in relation to special measures taken by the Czechoslovak Army in the maintenance of its equipment.

All T/E weapons and equipment went with training area for the annual summer training exercises. No additional weapons or equipment were issued to the unit when it arrived in the area. It did have additional weapons and equipment, but these remained in storage in Mlada-Milovice, and this equipment was only to be used in case of war, when the weapons in storage would be used by the personnel who would be drafted into the unit (up to 10,000 for the 3rd Tk. Div.). If the unit needed additional "live" ammunition for summer training, a truck was dispatched from the area to a storage point in Mlada. There were ammunition depots in the area around Mimon, but these were used only in case of a shortage or emergency, such as war. Otherwise, the unit had to go back to Mlada to get its ammunition.

6.

unit was alloted a certain number of rounds and when they were expended, it did not receive more. If the unit firing zeroed in on its target with a few rounds, it was scored as good and did not have extensive training in this phase.
